ABSTRACT

Zingiberaceae is well known as gingers family with abundant numbers of spices widely used in Southeast Asia, because of their unique flavors, ornamental and also the medicinal values. The extracts of Zingiberaceae rhizome contain many essentials oils, including terpenes, alcohols, ketones, flavonoids and phytoestrogens that use as medicine. Zingiberaceae grow vigorously in a wide range of habitats ranging from riverine to the limestone area, from lowland to the upper mountain regions. They often grow in shady area but some of the native species are able to tolerate to the sun exposure. The cultivation of this family was developed widely. Gunung Cut Village is one the villages in Aceh Barat Daya district which cultivated four species of this family: Zingiber officinale, Curcuma domestica, Alpina galanga and Kaempferia galanga. They mainly use for medicinal purposes as it can cure many diseases traditionally.

1. INTRODUCTION

Zingiberaceae is well known as gingers family with abundant numbers of spices widely used in Southeast Asia because of their unique flavors, ornamental and also the medicinal values (Aggarwal and Shishodia, 2006). The extracts of Zingiberaceae rhizome contain many essentials oils, including terpenes, alcohols, ketones, flavonoids and phytoestrogens that use as medicine. Zingiberaceae grow vigorously in a wide range of habitats ranging from riverine to the limestone area, from lowland to the upper mountain regions, they often grow in shady area but some of the native species are able to tolerate to the sun exposure (Larsen, 1999). Jatoi et al. (2007) mentioned that Zingiberaceae as the largest families in the plant kingdom, are distributed mainly in the tropical Asia. They comprise not only a prominent fraction of the undergrowth of tropical rain forest and monsoon forest, but also found in the secondary forest (Chen, 1989). As used gingers, this family consists of some genera such as; Alpina, Amomum, Curcuma, and Zingiber, followed by Boesenbergia, Kaempferia, Elettaria, Elettariopsis, Etlingera, and Hedychium are the most important. Most of the species are rhizomatous where the propagation often occurs through rhizomes (Jatoi et al., 2007). Zingiberaceae vary in height and size, from gigantic erect leafy shoots, which in some species achieve more height more than 8 m (e.g., Etlin-gera elatior), to plant as small as 10 cm or at nearly ground level such as Kaempferia galanga (Larsen et al., 1999). Zingiberaceae grow almost in all gardens in Gunung Cut Village. This village is the capital city of Tangan-tangan district in Aceh Barat Daya, Aceh, Indonesia with total area about 1.046 Ha. This area belongs to the tropical rain forest, where the society has a main job in growing Zingiberaceae medicinal and economical values. They use Zingiberaceae for many diseases such as; ear inflammation, cataract, kidney, infertility and others.

2. MATERIALS AND METHODS

2.1 Study area

The research was conducted from July to August 2018. All areas in Gunung Cut Village were selected for data collections.

2.2 Data collection

Data were collected through observation, documentation and personal interviews with the society (informant) using Snowball sampling (Chain sampling), where the information obtained from the main sources then could developed for further information’s. The informant determined based on the information from the leader in...
Gunung Cut Village such as; tribal leader, the head of the village, and trusted sources who know deeply related to research activities carried out.

3. RESULTS AND DISCUSSION

The results obtained in this study, from the informants, herbal medicine practitioner and the society in Gunung Cut Village mainly grow four species of Zingiberaceae (Table 1). Those species found could recover some diseases. Nature has been a source of medicinal agents for thousands of years and a lot of number of modern drugs has been isolated from natural sources that play a vital role in treatment of diseases (Cragg and Newman, 2001). Traditional medicinal plants usage are often cheaper, locally available and easily consumable, raw or as simple medicinal preparations. These simple medicinal preparations often bring out beneficial responses due to their active chemical constituents (Park and Pezutto, 2002). Natural chemical content in medicinal plants are generally known as “Chemical Goldmines” which are acceptable to human and animal system. Those important chemical cannot be synthesized in the laboratories. A lot of secondary metabolites in plant are commercially important and find use for pharmaceutical compounds. Human beings have been dependent on plants for their health care needs since the beginning of civilization. More than 80,000 plant species on earth are medicinal use (Dhanik et al, 2017).

### 3.1 Zingiber officinale

*Zingiber officinale* (Figure 1) is well known as ginger, one of the most important members from *Zingiberaceae* family. It values for medicinal, nutritional, and ethnomedical and extensively use worldwide as a spice, flavoring agent and herbal remedy (Grzanna et al, 2005; Dhanik et al, 2017). Phytochemical studies of gingers show that the rhizome contains a wide variety of biologically active compounds which impart medicinal property. Ginger is reported to possess essential oils, phenolic compounds flavonoids, carbohydrates, proteins, alkaloids, glycosides, saponins, steroid terpenoids and tannin as the major phytochemical groups (Dhanik et al, 2017). Ginger in Gunung Cut Village mainly used as herbal medicine to cure variety diseases; nausea, vomiting, asthma, cough, palpitation, inflammation, dyspepsia, loss of appetite, constipation, indigestion and pain.

According to Food and Agricultural Organization of United Nations: Economic and Social department: The statistical division (2013), Indonesia is one of top ten gingers producing country in the world (Table 2).

### 3.2 Curcuma domestica Vall

Turmeric (Figure 2) is a spice that has received much interest from both the medical and scientific worlds as well as from the culinary world (Priyadarshini, 2014). Curcumin has received worldwide attention for its multiple health benefits, including in Gunung Cut Village, they cultivated curcumin mainly for its health benefits especially through its anti-oxidant and anti-inflammatory mechanisms. According to Hewlings and Kalman (2017), these benefits are best achieved when curcumin is...
Curcumín is an important constituent of turmeric. A yellow-pigmented fraction isolated from the rhizomes of Curcuma contains curcuminoids belonging to dicinnamoylmethane group. Curcuminoids are presented to the extent of 3-5%. It is an important active ingredient responsible for the biological activity of Curcuma (Pandey and Katiyar, 2010).

3.3 Alpinia galanga (galangal)

The people in Gunung Cut Village intensively cultivate galangal (Figure 3) in their garden. The mixture of galangal with warm water could recover chest pain and sore throat. According to the explanation of Verma et al. (2011), different parts of this plant are traditionally used for the treatment of ailments including anti-fungal, anti-tumor, anti-helminthic, anti-diuretic, anti-ulcerative, heart disease, rheumatic pains, chest pain, dyspepsia fever, diabetes, burning of liver and kidney disease.

Scientific classification
Kingdom : Plantae
Division : Magnoliophyta
Class : Liliopsida
Order : Zingiberales
Family : Zingiberaceae
Genus : Alpinia
Species : Alpinia galanga

Galangal is a native of Indonesia although its exact origin is not known, but it naturalized spread to many parts of South and South East Asia. The oldest reports about its use and existence are from southern China and Java. The sub-Himalayan zone is also believed to be a natural home of galangal. It is mostly cultivated in home gardens and organized plantations do not exist. The Netherlands imports yearly over 100 tons of fresh rhizomes and about 30 tons of dried rhizomes. The main suppliers are Thailand, Indonesia and India (Scheffer and Jansen, 1999). Many investigations have been done for chemical content of galangal rhizome. The analyzed of a rhizome sample from Indonesia reported 1,8-cineole (47.3 %), α-pinene (11.5 %), β-pinene (7.1 %), α-thujene (6.2 %), terpinen-4-ol (6.0 %), α-terpineol limonene (4.3 %) each and many other compounds in lower concentrations (Ravindran and Divakaran, 2012).

3.4 Kaempferia galanga L.

Another important herb from Zingiberaceae that cultivated in Gunung Cut Village as herbal medicine is Kaempferia galanga L. Well known as kencur in Bahasa Indonesia. The society in Gunung Cut uses this herbs to cure fever, swollen and rheumatic also for culinary. The medicinal value of each parts of Kaempferia galanga L. have been studied for years. The rhizome, root stocks and leaves are used in different way for different medicinal purposes (figure 3). The leaves traditionally can be used for anti-inflammation, cure the sore throat, mood stabilizer, and increase the stamina. While the rhizome consumes for curing the diarrhea, anti-cancer, and stomachache.

Scientific classification
Kingdom : Plantae
Division : Magnoliophyta
Class : Liliopsida
Order : Zingiberales
Family : Zingiberaceae
Genus : Kaempferia
Species : Kaempferia galanga L.

According to the research had been done by Kanjanapothi et al. (2004), Kaempferia galanga L. has a lot of pharmacological activity, can be seen in the Table. 3.

From a review about this herbs mentioned that Kaempferia galanga L. is a major plant with many valuable medicinal properties. Although the rhizome is the main source of active principles, leaves are also being used in traditional medicine to treat swelling, headache, rheumatism etc. Extract of Kaempferia galanga L. have antioxidant, antimicrobial, analgesic, mosquito repellent sedative and wound healing activities (Nag and Mandal, 2015).

Figure 3. Different part of Kaempferia galanga L. (Nag and Mandal, 2015)

4. CONCLUSION

Gunung Cut is a village located in Aceh Barat Daya district, Aceh province, Indonesia. Zingiberaceae intensively cultivated in home garden in this village as medicinal plants, herbs, spice and economic purpose. There are four species of Zingiberaceae; Zingiberofficinale, Curcuma domestica Vall, Alpina galangal L., and Kaempferia galangaL.
